Individual Contribution Report

Student Name: Kathy Flores

Group: SureballNa (MiniOSNova)

Assigned Role: System Information, Error Handling, and Exit Support

What did I contribute to the project?

- Handled the system information, error handling, and exit features assigned to my part of the MiniOS project.
- Prepared to demonstrate how the system displays system information, responds to invalid commands, handles errors, and exits properly.
- Tested the commands assigned to my part to observe whether the system responds correctly to different inputs.

What features did I personally develop?

- **System Information (systeminfo):** Demonstrated how the command displays basic information about MiniOS, including its name, version, architecture, memory, and current user.
- **Error Handling:** Tested how the system responds when a user enters an unknown command, attempts to read a nonexistent file, or tries to terminate a process that does not exist.
- **Exit (exit):** Demonstrated how the user can properly shut down MiniOS and return to the command prompt.

What problems did I encounter?

- Some commands required careful testing to ensure that the system displayed the correct information and appropriate error messages.
- Invalid commands and requests involving nonexistent files or processes needed to be handled without causing the program to crash.

How did I solve those problems?

- Tested the assigned commands and observed the system's responses to different inputs.
- Checked whether the error messages were understandable and whether the system could continue running after an invalid command.
- Verified that the exit command properly ended the MiniOS session.

What did I learn from this project?

I learned how operating systems display system information and handle invalid user inputs. I also learned why error handling is important in preventing a program from crashing and how an exit command allows a user to end a program properly. This project helped me understand how basic operating system functions can be simulated using Python.

Evidence of my contribution:

- **Testing:** Demonstration and testing of the systeminfo, invalid command, missing file, nonexistent process, and exit commands.
- **Source Code Reference:** Relevant command implementations in the official GitHub repository: https://github.com/markelleryc-cpu/MiniOSNova.
