Report 2: Diel (User Authentication & Documentation Support)

Individual Contribution Report

- **Student Name:** Diel [Insert Last Name]
- **Group:** SureballNa (MiniOSNova)
- **Assigned Role:** User Authentication Developer & Documentation Support

What did I contribute to the project?

- Developed the user management module (users.py) to handle login authentication and track the active user session.
- Helped draft, format, and proofread the User Manual and Technical Documentation alongside the Project Leader.

What features did I personally develop?

- Programmed the user login verification system to check usernames and passwords before allowing access to the main OS prompt.
- Implemented the whoami command function to display the currently logged-in user during an active session.

What problems did I encounter?

- Accidental spaces typed at the beginning or end of the username caused valid login attempts to fail.
- The active username was initially not being saved properly after login, causing whoami to return an empty value.

How did I solve those problems?

- Used the .strip() method on the username input so accidental spaces would not break the login check.
- Stored the verified username in a state variable upon successful login so whoami always displays the active user accurately.

What did I learn from this project?

I learned how operating systems verify user credentials before booting into the command shell, how to pass variables between Python modules, and how to prepare clear technical documentation.

Evidence of my contribution:

- **Source Code:** Implementation of users.py in the official repository (https://github.com/markelleryc-cpu/MiniOSNova).

- **Project Documentation:** Contributions to the User Manual, Technical Documentation, and terminal test screenshots in the docs/ folder.
